REV A
Revised May 1993

781

Purpose

The Level 1 System 250 is designed for safe and rapid in-line warming of I.V. fluids as they are administered to patients. Disposable sets specifically designed for various infusion rates are available.

The standard Disposable Set allows infusion of 6°C blood up to 100 mL/min. or 6°C crystalloid up to 150 mL/min. Minimum delivery temperature at these flow rates is 35°C. At the somewhat lower flow rates generally used, fluids are delivered near 37°C. Blood and packed RBCs from all auto transfusion systems may be infused through the Level 1 I.V. Sets, and will be delivered near 37°C. High warming and flow capacity, simple operation, and on-board safety and monitoring systems make the Level 1 System 250 the ideal choice for all procedures requiring infusion of normothermic fluids. Typical uses of the system include all routine surgery and blood and fluid warming for I.C.U. and Emergency Room use.

Messages that are headed by "NOTE:" indicate information or procedures that if not followed correctly can cause improper results.

Messages that are headed by "CAUTION:" indicate information or procedures that if not followed correctly can cause improper results and damage to the equipment.

Messages that are headed by "WARNING:" indicate information or procedures that if not followed correctly can cause improper results, damage to the equipment, injury to personnel, or serious patient harm.

Concept

The Level 1 System 250 is the first significant advance in routine blood and fluid warming in over 20 years. It makes available to all other areas of the hospital the same fluid warming technology Perfusionists have safely used in the Open Heart Suite for on-pump warming for over 25 years.

The System 250 employs a Disposable Heat Exchanger. As with extracorporeal warming, warmed water is rapidly circulated counter-flow through an anodized aluminum tube. The use of a thermal conductor (aluminum), rapid water circulation, and counter-flow warming all contribute to the excellent high warming capacity of the System 250.

Taking advantage of the high warming capacity, the Disposable Sets allow increased fluid flow rates, even with very cold blood. The Filter Holder of the System 250 is warmed to help maintain peak efficiency at low flow rates.

The Hardware and Disposables of the Level 1 System 250 are integrated into the design to be highly effective and easy to use. By following the 1-2-3 instructions found on the unit, properly trained users can confidently have the system safely set-up and operating within seconds.

Safety

FILTER WITH GAS VENT

The Level 1 Disposable Sets employ a unique Gas Vent which vents micro-bubbles of gas which are always released from fluids as they are warmed. In many other warming systems, these micro-bubbles are actually delivered to the patient along with the warmed fluids.

The ability of the Gas Vent to quickly vent air also permits rapid priming of the Disposable Set. The Filter with Gas Vent in the I.V. Sets contains a 170-micron screen filter to trap macro-aggregates. This filter is connected with luer-locks and is easily changed without patient disconnection or repriming of the entire disposable set. The Filter with gas vent should be changed every three hours to maintain efficient system performance. Filter with gas vent replacement filters are available as follows:

For D-50 Set order replacement filter F-10

For D-100 Set order replacement filter F-10

TEMPERATURE CONTROL

The System 250 employs a safe circulating water heating system, inherently free of "hot spots". The primary temperature control circuit limits the circulating water to a 40°C maximum. In the unlikely event of a malfunction of this circuit, a second "watchdog" circuit will visually and audibly alarm and stop the circulating water pump if the temperature reaches about 41°C.

Fluid present in the heat exchanger while the unit is operating is never exposed to any damaging or dangerous temperatures.

ELECTRICAL SAFETY

A special low leakage immersion heater is used in the Level 1 System 250. This heater is electrically grounded through the power cord providing an extra measure of patient and operator safety.

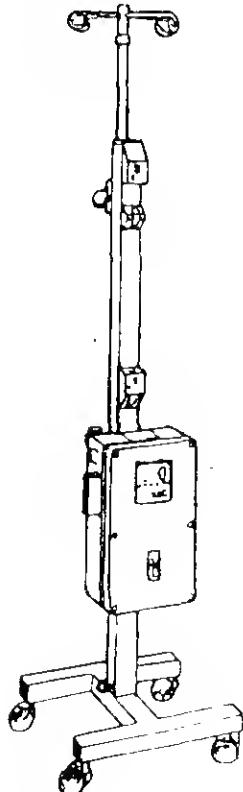

Figure 1

Unpacking and Set-Up

The Level 1 System 250 is packaged and partially assembled.

| Contents | Quantity |
|-----------------------|----------|
| UNIT PACKAGING | |
| Power Unit | 1 |
| Rolling Base | 1 |
| ACCESSORY PACK | |
| Service Manual | 1 |
| Operator's Manual | 1 |
| Casters | 4 |
| I.V. Bag Hanger | 1 |
| I.V. Pole Knob | 1 |
| Fill Plug | 1 |
| Set Up Card | 1 |
| Level 1 Video | 1 |
| Hitch Pin | 1 |

WARNING

This unit must be assembled and tested by Level 1 technical personnel or an authorized distributor of Level 1 prior to placing the device into service.

1. With the Rolling base on its side, push the four casters FULLY into their sockets. Place the base upright on its wheels.
2. Slide the Power Unit Pole down over the vertical square base tube with Power Unit facing the longer side of the base as shown in Figure 1.
3. Insert the PIN through the holes in the bottom of the pole and vertical base tube, locking them together.

Filling with Distilled Water

Set-Up

CAUTION

For proper system operation and component life, only DISTILLED WATER should be used in the water reservoir. The use of tap water in the unit will build up mineral scale and seriously reduce its operating efficiency.

DO NOT FILL the unit with a DISPOSABLE SET IN PLACE as this creates an air lock preventing proper filling.

A. Unscrew and remove the Fillport Plug.

B. Fill with 1.3 liters of Distilled Water. Note: A water reservoir vent port exits at the bottom of the Power Module at the location shown in Figure 3. This vent port also serves as an overflow tube. An easy way to be sure the reservoir is full is to place a cup under this vent port and fill the reservoir until water begins to exit the port.

C. Replace the Fillport Plug

CAUTION

The Distilled Water in the reservoir should be changed every 30 days. See the Maintenance section of this manual. The System 250 draws a maximum of 7.5 Amps. It should be plugged into a 10 to 20 Amp circuit, being sure there are no large power consumers on that circuit.

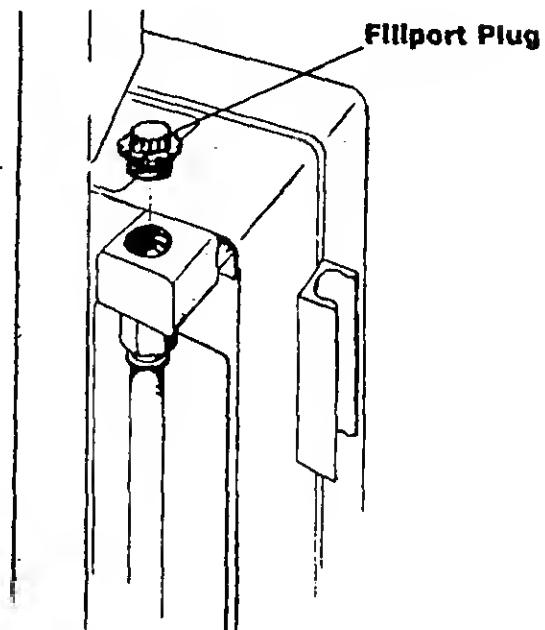

Figure 2

Electrical Safety

Power Requirement

Most of the current drawn by the System 250 is for its 600 Watt immersion heater. When the device is first turned on and the digital display shows rapidly rising temperatures below 30°C, the 600 Watt heater is in a full ON condition. Beyond approximately 30°C, the proportional controller cycles the heater ON/OFF with proportionally shorter ON times as the circulating water nears the 40°C target temperature.

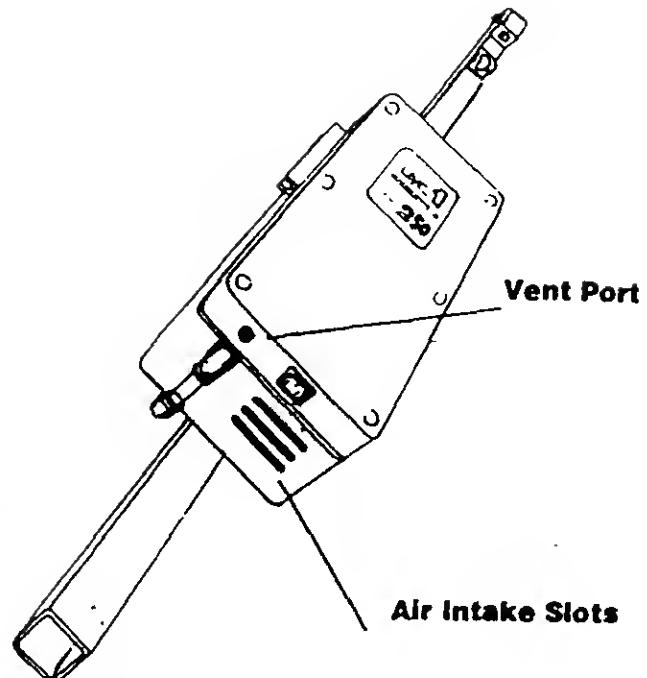

Figure 3

NOTE

This device is equipped with disposable sensing interlocks. A Level 1 Heat Exchanger is required to operate the device and perform leakage current testing. Non-Sterile Test Sets are available from Level 1 for this purpose. See the Parts List section of this manual.

WARNING

DO NOT DEFEAT THE DISPOSABLE SENSING INTERLOCKS OR TRY TO OPERATE THE UNIT WITHOUT A DISPOSABLE HEAT EXCHANGER IN PLACE.

Power On Leakage Current Tests should be performed with the immersion heater circuit in the full ON condition. In order to be sure the immersion heater circuit is in a full ON condition, Power On Leakage Current Tests should be performed on units which have been allowed to stand until close to room temperature. As the System 250 warms up quickly, test readings should be taken within 1 minute of startup.

Although the specifications claim less than 100 microamps electrical leakage, units leaving the factory are usually less than 50 microamps.

Units exceeding 100 microamps electrical leakage should be removed from service and returned to Level 1 for repair.

Alarm Testing

NOTE

Alarm testing requires a Level 1 Heat Exchanger to be in place on the System 250. Non-sterile Test Sets are available from Level 1 for this purpose. See the Parts List in this manual.

Add Water Alarm

The System 250 is equipped with a float switch which senses the water level in the on-board reservoir. When the water level is too low, a RED L.E.D. on the Display Panel illuminates and a sonic alarm sounds. In the alarm condition the circulating pump should not be running.

With a Test Heat Exchanger in place, the ADD WATER ALARM may be tested by releasing the water Fill/Drain tube on the back of the Power Unit and tilting it down to allow some of the water to drain out into a container. Replace any water drained with DISTILLED WATER. See the Filling with Distilled Water section of this manual.

Check Disposables Alert

Two interlocks sense a properly installed Heat Exchanger. If a properly installed Heat Exchanger is not in place and the Power Switch is ON, the RED indicator will illuminate and a pulsed alarm will sound. With the unit running, each interlock may be independently tested:

1. Top Heat Exchanger Socket - Pull Release knob and slide up.
2. Heat Exchanger Guide - Bend tube portion of Heat Exchanger out of Guide groove.

Over Temperature Alarm

With a Test Heat Exchanger in place and the Power Switch OFF, drain the water out of the reservoir by releasing the water Fill/Drain tube on the back of the Power Unit and tilting it down to a container. Fill with 1.3 liters of DISTILLED WATER which has been heated to 45°C to 48°C. (See FILLING WITH DISTILLED WATER section of this manual.) Turn the Power Switch ON. The Over temperature RED L.E.D. on the Display Panel should illuminate and the Sonic Alarm should sound. The water circulating pump should not be running. Confirming the above, turn the Power Switch OFF and allow the unit to cool to room temperature. Restart the unit and confirm normal operation.

NOTE

The sonic alarm and all RED L.E.D.s may be tested by pressing the alarm test button on the back of the cabinet.

Performance Testing

NOTE

Performance testing requires a Level 1 D-50 Disposable Set to be in place on the System 250. Non-sterile Disposable Test Sets are available from Level 1 for this purpose. See the Parts List section in this manual.

THREE simple tests allow periodic checking of the overall operating efficiency of the System 250.

1. COLD START TEST

Store the System 250 unit in a room where the room temperature is approximately 21°C (70°F). With a D-50 Set in place, note the time and turn the Power Switch ON. The Green System Operational indicator will illuminate. Rapidly rising numbers will appear on the Water Temperature display. 37°C will appear in approximately 3 minutes on an efficiently operating unit.

2. SYSTEM RECOVERY TEST

Chill a 1 liter bag of Normal Saline to 10°C to 15°C. With a D-50 Test Set in place, turn the Power Switch ON and allow the unit to reach at least 39.5°C. Remove the cap from the Male Luer at the end of the Patient Line and place the Male Luer in a container on the floor. Close the Bag Spike clamps, and spike the fluid bag. Set the I.V. Pole so the fluid bag outlet is 4" above the level of the Heat Exchanger inlet. With all clamps open, fluid will flow at 250 mL/min. (This may be confirmed with a graduated beaker and stopwatch.)

Note the time and OPEN the clamp below the bag, allowing the fluid to flow freely. Watch the Water Temperature display. The fluid bag should empty in about 4 minutes, and the digital display in an efficiently operating unit will not read below 37°C.

3. STEADY STATE RUN TEST

Thermal Calibration Well (TCW) P/N 80-03-002

NOTE

Use of this unit requires a digital thermometer NIST traceable and accurate within 0.1°C.

Required probe size: 0.099" OD maximum
0.50" - 1.50" long

Short checklist to verify displayed circulating water temperature:

- a. Install TCW in machine in normal heat exchanger position (sockets 1 & 2).

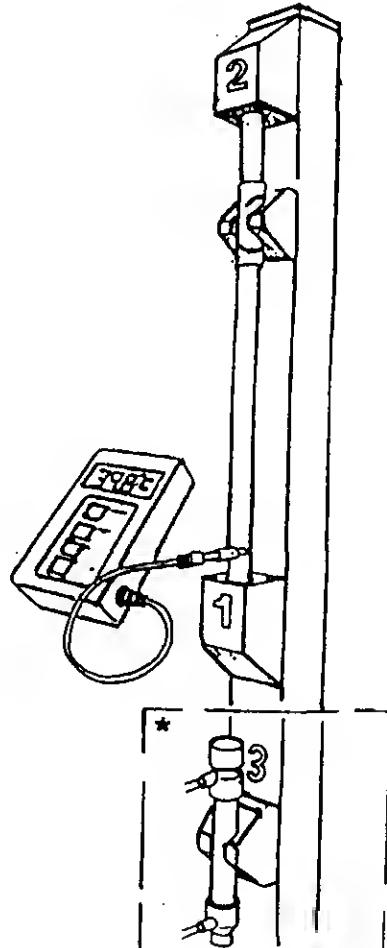

*For H-500 & H-500 INT, also install a test filter at position 3.

b. Turn the machine on and allow to warm up for 15 minutes. Insert thermometer probe fully into well and allow display to stabilize. Compare temperatures.

Unit display will be within 0.3°C of the thermometer display on a correctly calibrated unit.

Examples:

Thermometer 39.7°C
Level 1 Unit WITHIN THIS RANGE 39.4°C - 40.0°C = OK

Thermometer 40.0°C

Level 1 Unit WITHIN THIS RANGE 39.7°C - 40.3°C = OK

NOTE

IF THE SYSTEM 250 DOES NOT MEET 1, 2, or 3, IT SHOULD BE RETURNED TO THE FACTORY FOR SERVICE.

Maintenance

CLEAN EXTERIOR -- EVERY USE

Clean the entire System 250 with a spray of warm soapy water solution or a commercial non-abrasive cleaner and a soft cloth after every use. Cold sterilizing solutions may be used, but strong chemical concentrations may discolor some of the plastics on the device. Do not use cleaning agents containing abrasives.

CHANGE DISTILLED WATER -- EVERY 30 DAYS

Release the water Fill/Drain tube behind the Power Unit and tilt it down to allow the water to drain into a container. Replace the tube by pushing firmly up into the fitting until it bottoms. Refill with 1.3 liters of distilled water. See FILLING WITH DISTILLED WATER section of this manual.

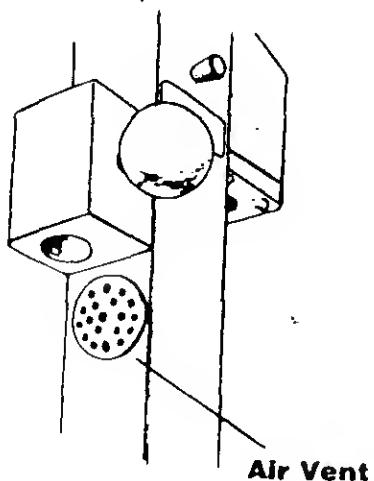

GREASE O-RING SEALS -- EVERY 30 DAYS

Place a small amount of silicone grease on a cotton swab or the end of a small finger and apply all around the O-Rings in the bottom and top heat exchanger sockets of the Pole Assembly. It is not necessary to disassemble the sockets to grease them.

CHANGE O-RING SEALS -- EVERY 12 MONTHS

Note: An O-Ring Kit containing 2 O-Rings, 1 1/8" hex wrench and silicone grease is available from Level 1. See the Parts List in this manual. Using a 1/8" hex wrench, unscrew the four stainless button head screws of each socket and remove the rectangular Socket Caps. After removing and discarding the old O-Rings, clean the O-Ring sockets. Coat the new O-Rings with silicone grease and press them into their sockets. Replace the Socket Caps and button head screws.

GENERAL INSPECTION -- EVERY USE

Visually check the condition of the device. Remove any unit from service which shows physical damage or one in which the Test Disposable Set does not install easily.

This unit is cooled by convection. Be sure the air intake slots on the bottom of the cabinet (refer to Figure 3) and air vent below the I.V. Pole mount (figure 4) are not blocked.

Figure 4

Troubleshooting

Inoperable System 250

| PROBLEM | CHECK |
|--|--|
| NO POWER | Unit is PLUGGED IN? Power Switch ON? Minimum 10 AMP circuit? Note: If power is reaching the unit from the wall and the Power Switch is turned ON, the switch will GLOW. |
| NO GREEN SYSTEM OPERATIONAL LIGHT and CHECK DISPOSABLES ALARM | Heat Exchanger properly installed? Pole Interlocks (2) properly engaged by the Heat Exchanger? |
| ADD WATER ALARM WHEN UNIT IS MOVED | Add about 150 ml distilled water to the reservoir through the Fill Port. |
| ADD WATER ALARM WHEN UNIT IS TURNED ON | Fill with distilled water until alarm stops. Refer to Service Manual for complete draining and filling instructions. |
| OVER-TEMPERATURE ALARM | Turn off the Power Switch and remove the Unit from service. It must be repaired or replaced by Level 1 Technologies, Inc. |
| | <p>Note: Room temperature above 40°C (104°F) or filling with distilled water above 40°C, may cause the H-250 to shut down and alarm. In this unusual situation, turn the Power Switch OFF and allow the unit to cool off before returning it to service.</p> |

EXCHANGER SOCKETS

Replace O-Rings.
Order Part No. 80-04-003.

TROUBLESHOOTING FLOW RESTRICTION, I.V. DISPOSABLE SETS

Many factors which are insignificant in low fluid administration are restrictors of higher flow infusion. If you encounter flow restriction CHECK EACH OF THESE POSSIBLE CAUSES.

OLD BLOOD

Stored blood begins to develop particulate within 5 to 7 days. This may partially block fluid pathways, impeding flow.

FULLY SPIKED BAG

Bag port membranes may only be split, not completely pierced.

BAG PORT FILTER(if used)

40 micron to 80 micron filters used between the blood bag and the bag spike of the Disposable set may restrict flow because:

1. Cold, viscous blood does not flow well through small pore filters.
2. As they are directly connected to the source of particulate with no pre-filtering, they clog quickly.
3. They may trap air which can block filter media surface area.

CLAMPS PARTLY ENGAGED

Check to be sure all clamps are FULLY open.

TUBE SET

Leaving clamps engaged for extended periods of time when the Disposable Set is not in use (such as pre-set-up) will cause the tubing to take a SET in the clamped position.

TUBE KINK

Be sure no tube kinks are present anywhere in the set, especially in the Y-set when a pressure cuff is employed and the I.V. Pole is used in a lowered position.

TRAPPED AIR IN FILTER

As noted in the Priming Instructions, remove the Filter from the holder and tap against the Cabinet to dislodge air bubbles and allow them to vent out.

CLOGGED FILTER

If good quality blood is used, this filter should never cause flow restriction. In the event of a clogged filter, this component may be changed. See REPLACING FILTERS section of this manual. If frequent clogging is encountered, discuss the QUALITY of the blood being used with your Blood Bank.

EXTENSION LINES

Use only extension lines with a bore of .130" (3.3 mm) or larger, equipped with large bore fittings, such as Level 1 Part No's. X-36 or Y-30.

STOPCOCK or Y ADAPTER

Any fittings attached to the male luer-lock at the end of the Patient Line should have large bores. If their bores are smaller than the male luer-lock bore, they are restrictors.

NEEDLE or CATHETER

If possible, use a minimum 14 Gauge needle or 8.5 French catheter. Smaller sizes will reduce flow.

QUALITY OF INFUSION SITE

Poorly placed needles and catheters do not allow high infusion rates.

Limited Warranty

LEVEL 1 FLUID WARMER SYSTEM 250 MODEL H-250

This Level 1 Fluid Warmer is warranted by Level 1 Technologies, Inc. to be free of material and workmanship defects for a period of 1 year (12 months) from the date of purchase, abuse and impact damage excluded. Level 1 reserves the right to replace any or all components in lieu of repair. During the period this warranty is in effect, any Level 1 H-250 Fluid Warmer found to be defective and shipped to Level 1, shipping costs prepaid, will be repaired or replaced. This warranty does not cover misuse, impact damage or obvious abuse of the device. No warranty or affirmation of fact, expressed or implied, other than stated above, is made or authorized by Level 1, and Level 1's liability in all events is limited to the purchase price paid for the device.

SERIAL NUMBER LABEL

Power Modules returned for Warranty service must have Serial Numbers intact. Those with missing or altered Serial Numbers will be serviced as Non-Warranty repairs.

PROMPT DISPOSITION

Level 1 will make a good faith effort for prompt correction or other adjustment with respect to any product which proves to be defective within warranty. See the Service Section of the manual for shipping information for product requiring service.

Service

ALL SERVICE MUST BE PERFORMED BY LEVEL 1 TECHNOLOGIES OR ITS AUTHORIZED AGENTS. SERVICE BY OTHERS VOIDS THE WARRANTY AND TRANSFERS LIABILITY FOR MALFUNCTIONS OF THE DEVICE TO THE SERVICING ORGANIZATION.

Contact the Level 1 Service Department before shipping the unit to Level 1 for repair. The Service Department will issue you a Return Authorization Number (RAN). The Service Department will want to know the SERIAL NUMBER of your machine and a description of the problem.

Be sure that ALL water is drained from the unit before packing it for shipment.

NOTE: ALL machines must be cleaned and disinfected or they will be immediately returned as received.

FOR SERVICE, CONTACT: 800-553-8351
LEVEL 1 TECHNOLOGIES 617-878-8011
(or your local distributor)

The Level 1 System 250 is designed for easy disassembly so the Power Unit, I.V. Pole or Rolling Base may be sent to the factory for service. Generally, disassembly is the reverse of the assembly steps found in the UNPACKING AND SET-UP section of this manual. Drain the water from the Power Unit before disassembly. Be sure ALL water is drained before packing any Power Unit for repair shipment.

The Power Unit is secured to the Rolling Base by a Hitch Pin. Remove the Pin to separate the Power Unit from the Rolling Base.

For service ship prepaid to:
SERVICE DEPARTMENT
LEVEL 1 TECHNOLOGIES, INC.
160 WEYMOUTH STREET
ROCKLAND, MA 02370

Include the following:

Hospital Name

Address

Telephone Number

Person to Contact

Apparent Problem

WARRANTY SERVICE

Units received for repair which have not been obviously abused or impact damaged and still under warranty will be promptly repaired and returned at no charge. See the Limited Warranty section of this manual.

NON-WARRANTY SERVICE

Units received which have suffered obvious abuse or impact damage and units no longer under Warranty will be promptly inspected and a written estimate of repair costs will be sent to you. A purchase order will be required from the hospital consistent with the written estimate.

Electrical Schematics

The Electrical Schematics in this manual are for information only. They are NOT intended for user service. Any service performed on this unit, not authorized by Level 1, will void the warranty (if in effect) and TRANSFER LIABILITY for any malfunction TO THE SERVICING ORGANIZATION.

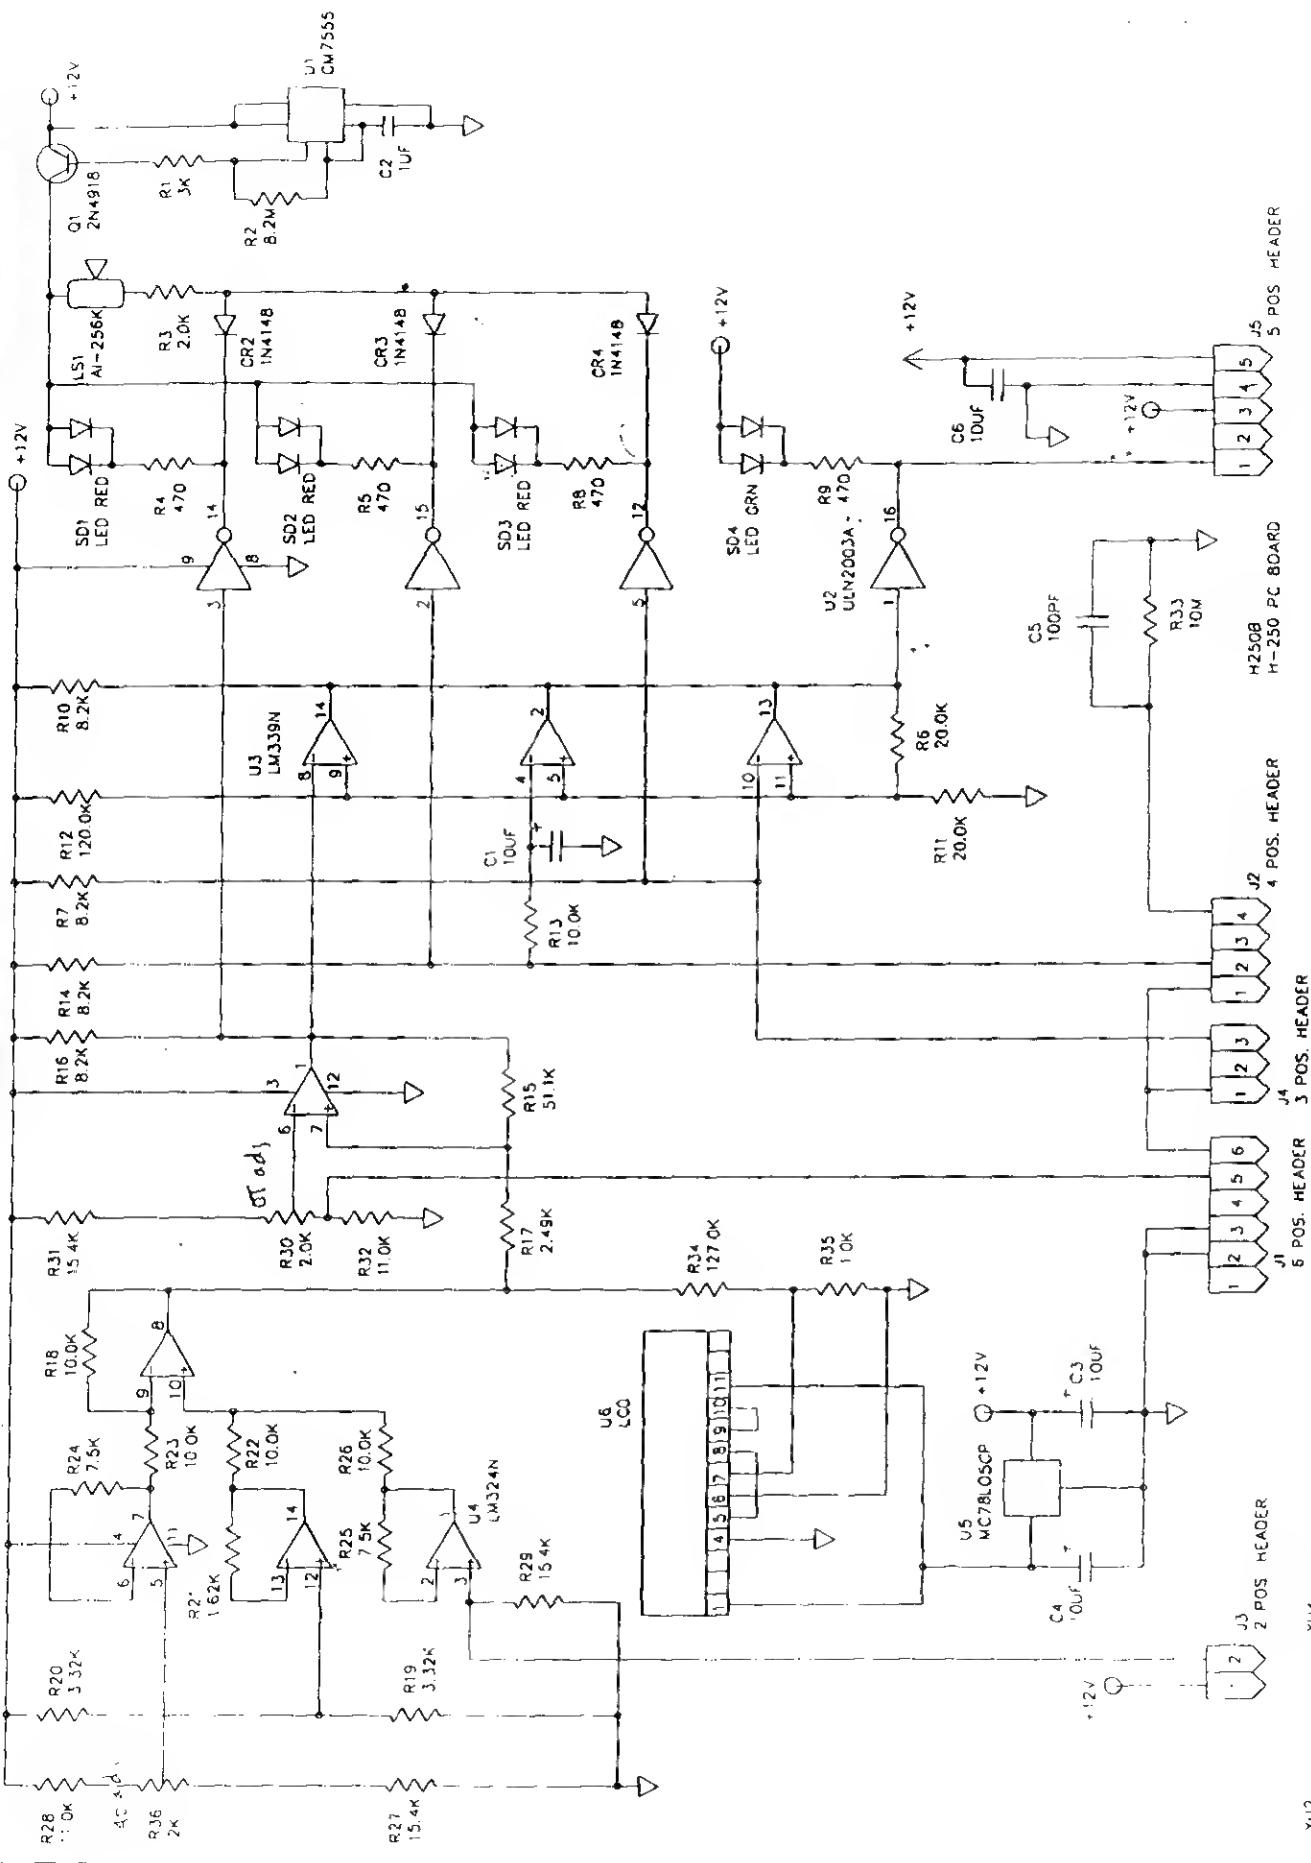

CAUTION:

Precision thermometry equipment accurate to 1/10 of 1°C and NIST traceability is required for correct calibration of the Level 1 H-250 Fluid Warmer.

As this equipment is not normally found in a hospital biomedical engineering department, Level 1 considers the H-250 NOT USER SERVICEABLE for electrical circuit repairs or adjustments. Temperature adjustments are factory sealed and tamper evident.

File Name: HSOP002.DOC

8. CHECK FLOAT SWITCH

8.1 TO CHECK FLOAT SWITCH, DISCONNECT FILLPORT TUBING AND DRAIN WATER UNTIL WATER LEVEL ALARM SOUNDS. REFILL WATER TO RE-OPERATE.

9. SET UNIT AT 39.9 FOR DOMESTIC AND 40.9 FOR INTERNATIONAL

9.1 TURN TEMP. CONTROLLER POT CW TO INCREASE TEMPERATURE

9.2 A SMALL TURN OF THE POT IS A LARGE INCREASE IN TEMP.

9.3 ALLOW TIME TO STABILIZE TEMP. BETWEEN ADJUSTMENTS.

9.4 SET UNIT TO RUN AT $39.9^{\circ}\text{C} \pm 0.1^{\circ}\text{C}$ FOR DOMESTIC AND $40.9^{\circ}\text{C} \pm 0.1^{\circ}\text{C}$ FOR INTERNATIONAL.

10. COLD START

10.1 TURN UNIT OFF. REPLACE WARM WATER WITH COLD.

10.2 PLACE A CLAMP CURRENT METER AROUND ONE OF THE CIRCUIT BREAKER WIRES (LINE OR NEUTRAL). SET METER ON 6 AMP RANGE.

10.3 TURN UNIT ON. THE UNIT CURRENT SHOULD CHANGE FROM A CONSTANT DRAW TO PULSE MODE AT $39.2 \pm 0.3^{\circ}\text{C}$ FOR DOMESTIC AND $40.2 \pm 0.3^{\circ}\text{C}$ FOR INTERNATIONAL.

11. CHECK FLOW RATE

11.1 REMOVE CALIBRATED T-40 THERMOMETER AND REPLACE WITH FLOW RATE METER. THE FLOW RATE OF THE CIRCULATING WATER MAY BE 1.5 GALLONS PER MINUTE.

IDLE CHECK

12.1 ALLOW UNIT TO RUN FOR 1 HOUR. ENSURE $39.9^{\circ}\text{C} \pm 0.1^{\circ}\text{C}$ FOR DOMESTIC AND $40.9^{\circ}\text{C} \pm 0.1^{\circ}\text{C}$ FOR INTERNATIONAL.

13. SEND UNIT TO Q.A. FOR ELECTRICAL TESTING AND FINAL INSPECTION.

File Name: HSOP002.DOC

1. SET UP

1.1 RECORD THE RESULTS OF THE FOLLOWING ON H.S.O.P. 002.5 IF THE UNIT UNDER TEST FAILS TO MEET THE FOLLOWING TEST PARAMETERS TAG THE MACHINE WITH A DESCRIPTION OF THE FAILURE AND NOTIFY YOUR SUPERVISOR.
1.2 FILL UNIT WITH TAP WATER.
1.3 INSTALL THE CALIBRATED T-40 THERMOMETER.
1.4 RECORD THE CALIBRATED THERMOMETER SERIAL #, YOUR NAME, AND THE DATE ON THE CALIBRATION WORKSHEET. (H.S.O.P. 002.5). ALSO RECORD THE AMBIENT TEMPERATURE.

2. CHECK FOR LEAKS

2.1 TURN UNIT ON. OBSERVE ALL FITTINGS AND SEAMS IN THE CIRCULATING WATER SYSTEM FOR LEAKS.

3. CHECK POWER SUPPLY VOLTAGE

3.1 PLACE DC VOLTAGE METER LEADS ACROSS THE PCB CONNECTOR (J5), BLACK AND RED WIRES, THE MEASUREMENT SHOULD READ 12 VOLTS \pm 0.1 VOLTS.
3.2 ADJUST POWER SUPPLY OUTPUT IF NECESSARY.

4. SET OVER TEMP. ALARM

4.1 WATER TEMPERATURE MUST BE AT LEAST 39.5 DEGREES (C) TO PROCEED WITH TEST.
4.2 ADJUST THE 40 ADJ. POT SO THE LCD READS 41.5 \pm 0.0°C FOR DOMESTIC AND 42.0 \pm 0.0°C FOR INTERNATIONAL.
4.3 ADJUST THE OVERTEMPERATURE CLOCKWISE UNTIL THE ALARM SOUNDS.
4.4 ADJUST THE 40 ADJ. POT COUNTERCLOCKWISE AND CONFIRM THAT THE ALARM DEACTIVATES AT 40.2 \pm 0.2°C FOR DOMESTIC AND 40.7 \pm 0.2°C FOR INTERNATIONAL.
4.5 ADJUST THE 10 ADJ. POT COUNTERCLOCKWISE AND CONFIRM THAT THE ALARM ACTIVATES AT 41.5 \pm 0.0°C FOR DOMESTIC AND 42.0 \pm 0.0°C FOR INTERNATIONAL.
4.6 REPEAT STEPS, TWO TIMES TO CONFIRM THE ACTIVATION AND DEACTIVATION POINTS.

5. SET CALIBRATION OF DISPLAY

5.1 COMPARE UNIT LCD TO CALIBRATED THERMOMETER DISPLAY.
5.2 TURN THE 40 ADJ. POT ON PCB SO THAT THE UNIT LCD IS EQUAL TO THE CALIBRATED THERMOMETER LCD \pm 0.0°C.

6. POLE INTERLOCK SWITCH TEST

6.1 CHECK TOP SOCKET WHILE LATCHED DOWN. GRASP FIRMLY AND MOVE IN ALL DIRECTIONS. UNIT SHOULD NOT ALARM. RELEASE LATCH AND SOCKET UPWARDS. ALARM SHOULD ACTIVATE. RETURN SOCKET TO LATCHED POSITION. UNIT SHOULD BE OPERATIONAL.
6.2 TO CHECK POLE INTERLOCK SPRING HEAT EXCHANGER OUT OF INTERLOCK THE ALARM SHOULD ACTIVATE. RETURN HEAT EXCHANGER INTO INTERLOCK AND THE UNIT SHOULD BECOME OPERATIONAL.

7. ALARM TEST SWITCHES

7.1 DEPRESS ALARM TEST SWITCH AND THE GREEN LED SHOULD TURN OFF. ALL RED LED'S SHOULD BE FLASHING AND THE ALARM MUST BE AUDIBLE. RELEASE SWITCH AND THE SYSTEM SHOULD BECOME OPERATIONAL.
